RESEARCH OVERVIEW / VERSION 1.0.0 / OCTOBER 2026

Universal Control Planes and Scoring Tree/Forest/Folding

For Structural Intelligence (UCPSF) | Sizhe Tan & GPT-Obot

KEY IDEA

Complex AI systems need more than powerful intelligence engines: they need structured, reusable, evidence-driven mechanisms to evaluate, compose, select, and govern intelligent computation. UCPSF proposes Generalized Scoring Intelligence and a Universal Control Plane as a unified research architecture.

TWO RESEARCH PILLARS

01 GENERALIZED SCORING INTELLIGENCE	02 CONTROL PLANE + DUAL-HYBRID INTELLIGENCE
Scoring operators; Scoring Trees and Forests; Unaligned AND Folding; Common Concept Core (CCC) extraction; recursive distillation; Perspective-Aware Meta-Scoring.	Adaptive Localization and Per-Node Intelligence; heterogeneous engine selection; scoring and evidence contracts; independent validation; governed Structural RSI.

EIGHT CORE RESEARCH PAPERS

UCPSF-001 From Primitive Scoring to Generalized Scoring Intelligence

UCPSF-002 Universal Control Planes and Three Scoring Operators

UCPSF-003 Scoring Trees, Forests, and Unaligned AND Folding

UCPSF-004 Common Concept Core Extraction and Recursive Distillation

UCPSF-005 Perspective-Aware Optimization and Meta-Scoring Intelligence

UCPSF-006 Hybrid Localization and Per-Node Intelligence

UCPSF-007 Universal Control Plane Architecture and Structural RSI

UCPSF-008 Open-Ended Scoring Intelligence and the Future of AI

THREE CONCEPTUAL CASE STUDIES

CASE-001 Scoring Control in AI Relay

CASE-002 Scoring-Guided Structural RSI

CASE-003 Hybrid Localization and Per-Node Selection

RESEARCH STATUS

Theory-first architectural release: eight papers, three conceptual case studies, figure specifications, research roadmap, and falsification agenda. Proposed mechanisms are not yet independently validated; no completed benchmark results or production runtime are claimed.
